

Testing MusiCure Pillow at an adult daycare center in Denmark

Nursing home resident 1, diagnosed with Alzheimers. Said after listening 1/2 hour to MusiCure Pillow:

"What lovely music, I would like to do this again."

Observations from the staff: The facial expression was nicely relaxed: The resident was not so testy and showed more calmness in movements after trying the pillow.

Nursing home resident 2, diagnosed with Alzheimer's disease and Tinnitus. Said after listening 1 hour to MusiCure Pillow:

"A wonderful experience ... I do not want to stand up. When can I try again."

Observations from the staff: Residents tend to be restless, walk around a lot all the time, but was very relaxed and calm after one hour with the pillow. Has subsequently chosen to buy the pillow.

Nursing home resident 3, diagnosed with Parkinson. Said after listening 1/2 hour to MusiCure Pillow:

"Very enjoyable, think it can help me to relax."

Observations from the staff: Closed his eyes immediately, and the body seemed relaxed.

Nursing home resident 4, diagnosed with Parkinson, and spends most of the day in bed. Said after listening 1 hour to MusiCure Pillow:

"Thanks for the nice music, you're the nicest person I know."

Observations from the staff: relaxed, and with a smile.

Nursing home resident 5, diagnosed with dementia and in delirium (just returned from the hospital after a fracture/surgery).

Listened to MusiCure Pillow ***"a whole evening with breaks (regularly supervised by the staff)"***

Observations from the staff: Resident has difficulties rising from chair, which is not very appropriate and a danger to him ... was put to bed for the night and was very uneasy. But when the head hit the pillow and the music was turned on, the resident became calm and facial expression was relaxed. The resident fell silent asleep. Obvious that the resident was relaxed and felt secure when using the pillow.
